---

Dear Hiring Manager,

I am writing to express my interest in the Backend Engineering position. With over five years of experience as a Software Development Engineer, I specialize in building and scaling high-performance backend systems using Python frameworks such as FastAPI and Flask, particularly within high-throughput domains like payments and financial workflows.

In my current role at Head Digital Works, I design and develop core microservices powering payment processing, KYC verification, and bank account validation. Some of my key technical contributions include:

- **Database Optimization:** Designing schemas, optimizing complex queries, and performance tuning in PostgreSQL alongside SQLAlchemy and AWS SDKs, which significantly reduced API latency and improved overall system efficiency.
- **Architecture & Scalability:** Building distributed, event-driven architectures utilizing AWS, GCP, and RabbitMQ to handle large-scale concurrent data processing workflows efficiently.
- **Production Excellence:** Writing modular, testable, and production-grade code within Unix/Linux environments, while collaborating closely with cross-functional teams to debug production issues and maintain high system reliability.

I am particularly drawn to this position because of your team's focus on scalable backend development and continuous performance optimization—areas where I have a proven track record of delivering results and am deeply passionate about.

I would welcome the opportunity to discuss how my background in backend engineering, system design, and performance tuning can add value to your team. Thank you for your time and consideration.

Sincerely,

Sahil Kureel
